Chapter 1

HTTP API

EIT API

Device status

Resource for storing and fetching the status of a device with a given id.

Get device status

0.1 **GET** /status/{device}

```
RESPONSE

200 (OK)
Content-Type: application/json

{
    "timestamp": "Timestamp in milliseconds when the server received the last status update",
    "_id": "Database id, not needed for anything",
    "device_id": "The same as the {device}-part of the request",
    "data1": "3.141529",
    "data_2": "2.71828",
    "and so on...": "any data the device has sent to the server",
    ...
}
```

Set device status

0.2 POST /status/{device}

```
REQUEST | raw

Content-Type: application/json | 

{
    "data1": "3.141529",
    "data_2": "2.71828",
```

```
"and so on...": "any data here will be stored by the server",
...

RESPONSE

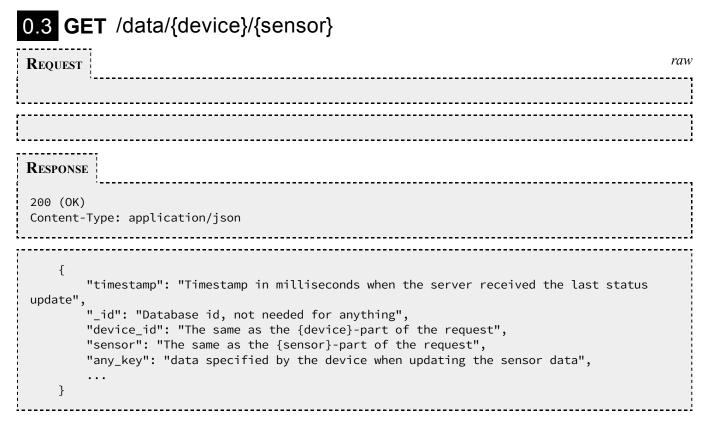

200 (OK)
Content-Type: application/json

Will return the same as a GET request to [/command/{device}]
```

Manage sensor data for a single sensor

Resource for storing and fetching sensor data for a given sensor for a given device.

Get sensor data

Set sensor data

0.4 POST /data/{device}/{sensor}

```
REQUEST raw

Content-Type: application/json
```

```
{
    "any_key": "data specified by the device when updating the sensor data",
    ...
}

RESPONSE

200 (OK)
Content-Type: application/json

Will return the same as a GET request to [/command/{device}]
```

Manage sensor data for multiple sensors

Resource for storing and fetching sensor data for all sensors for a given device.

Get the data from all the device's sensors

Set the data for several of the device's sensors

0.6 POST /data/{device}

```
Content-Type: application/json

[
{
    "sensor": "The id of this sensor",
    ...
},
{
    "sensor": "The id of this sensor",
    ...
]

RESPONSE

200 (OK)
Content-Type: application/json
```

Manage a device's command queue

Resource for adding commands to a device's command queue and retrieving the command queue.

Get the device's command queue and flush it

Will return the same as a GET request to [/command/{device}]

0.7 **GET** /command/{device}

Request	raw
Response	
200 (OK) Content-Type: application/json	

```
[
{
    "timestamp": "Timestamp in milliseconds when the server received the last status
update",
    "any_key": "Any data can go here",
    ...
},
...
]
```

Add a command to the device's command queue

0.8 POST /command/{device}

```
REQUEST

Content-Type: application/json

{
    "any_key": "Any data can go here",
    ...
}

RESPONSE

200 (OK)
Content-Type: application/json
```

Chapter 4

Server code

4.1 Installation notes

```
Requirements:
MongoDB
Python

pip (http://www.pip-installer.org/en/latest/)

virtualenv (http://www.virtualenv.org/en/latest/)

Setup:
In this directory:
# virtualenv --no-site-packages venv
# source venv/bin/activate
# pip install -r requirements.txt
# python server/server.py
```

server/INSTALL

4.2 Utility functions

```
from flask import Response
from functools import wraps
from helpers import unicode_to_str
